

Written Analysis

When comparing the 'District schools' vs. 'Charter Schools', district schools consistently outperform charter schools. District schools have higher average scores in math and reading, a higher percentage of students passing both subjects, and a better overall passing rate. This indicates that the resources of district schools may be more effective than those of charter schools in achieving academic success.

Looking at the overall results, it's apparent that smaller schools tend to outperform larger schools. In smaller schools, both the math and reading scores are listed higher, while larger schools on average have much lower overall passing rates

Even with a big financial investment in education, only 65.17% of students are passing both math and reading, showing little room for improvement. The gap between the math passing rate (74.98%) and the reading passing rate (85.81%) compared to the overall passing rate suggests the money and resources aren't focused on what students need most.
